# BIOSECURITY GUIDANCE FOR INFECTIOUS DISEASES

////////////////////

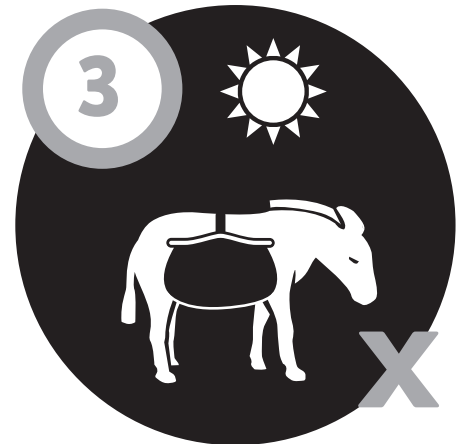

**YOU CAN PROTECT YOUR DONKEY FROM MANY DISEASES:**

Keep your healthy donkey/ mule away from other donkeys/ mules/horses as they may be sick – avoid going to market.

If you or your family go near other donkeys/mules/horses it is important to wash your clothes, footwear and hands before going near your own donkey/mule.

Try not to overwork or stress your donkey/mule as it will become more likely to suffer the disease. Old, young and weak donkey/ mules are most vulnerable.

If new donkeys/mules/horses come to your area try to keep them away from other animals for 14 days to make sure that they are not infected before mixing with your donkey/mule.

If your donkey/mule starts to show signs of weakness, tiredness, coughing, runny nose and runny eyes, rest and isolate it immediately and seek professional advice. Your donkey/mule should have access to clean water and plentiful forage for a quick recovery.

**Be aware that the movement of live donkeys, mules and horses or their products will put your donkeys (and other equids) at risk.**
